

# MATH50010: Probability for Statistics

## Problem Sheet 4

1. The joint pdf of the random variables  $X_1$  and  $X_2$  is

$$f_{X_1, X_2}(x_1, x_2) = k \exp \left\{ - \left( \frac{x_1^2}{6} - \frac{x_1 x_2}{3} + \frac{2x_2^2}{3} \right) \right\}, \text{ for } -\infty < x_1, x_2 < \infty.$$

Find  $E(X_1)$ ,  $E(X_2)$ ,  $\text{Var}(X_1)$ ,  $\text{Var}(X_2)$ ,  $\text{Cov}(X_1, X_2)$  and  $k$ .

2. Suppose

$$\begin{pmatrix} X_1 \\ X_2 \end{pmatrix} \sim N_2 \left[ \mu = \begin{pmatrix} 2 \\ -5 \end{pmatrix}, \Sigma = \begin{pmatrix} 1 & -0.5 \\ -0.5 & 4 \end{pmatrix} \right].$$

Compute  $\Pr(X_1 > 0)$  and  $\Pr(X_2 < -6)$ .

3. Suppose  $X_1$ ,  $X_2$ , and  $X_3$  are iid  $N(1, 1)$  random variables. Let  $X_4 = 2X_2 + 2X_3$  and  $X_5 = X_2 - 2X_3$ .

- (a) Find the joint pdf of  $(X_1, X_4, X_5)$ .
- (b) Find the marginal pdf of  $X_5$ .

4. Suppose that  $X$  and  $Y$  are absolutely continuous random variables with pdf given by

$$f_{X,Y}(x, y) = \frac{1}{2\pi} \exp \left\{ -\frac{1}{2} (x^2 + y^2) \right\}, \text{ for } x, y \in \mathbb{R}.$$

- (a) Let the random variable  $U$  be defined by  $U = X/Y$ . Find the pdf of  $U$ . Do you recognize the distribution of  $U$ ?
- (b) Suppose now that  $S \sim \chi_\nu^2$  is independent of  $X$  and  $Y$ . (The pdf of  $S$  is given by

$$f_S(s) = c(\nu) s^{\nu/2-1} e^{-s/2}, \text{ for } s > 0,$$

where  $\nu$  is a positive integer and  $c(\nu)$  is a normalizing constant depending on  $\nu$ .) Find the pdf of random variable  $T$  defined by

$$T = \frac{X}{\sqrt{S/\nu}}.$$

Show that this is the pdf of a  $t$  random variable with  $\nu$  degrees of freedom.

5. Suppose that  $U_1$  and  $U_2$  are independent and identically distributed  $\text{Unif}(0, 1)$  random variables. Let random variables  $Z_1$  and  $Z_2$  be defined by

$$Z_1 = \sqrt{-2 \log(U_1)} \cos(2\pi U_2),$$

$$Z_2 = \sqrt{-2 \log(U_1)} \sin(2\pi U_2).$$

Find the joint pdf of  $(Z_1, Z_2)$ .

6. Suppose  $(X_1, \dots, X_n)$  is a collection of independent and identically distributed random variables taking values on  $\mathbb{X}$  with pmf/pdf  $f_X$  and cdf  $F_X$ . Let  $Y_n$  and  $Z_n$  correspond to the *maximum* and *minimum* order statistics derived from  $(X_1, \dots, X_n)$ , that is

$$Y_n = \max \{X_1, \dots, X_n\}, \quad Z_n = \min \{X_1, \dots, X_n\}.$$

- (a) Show that the cdfs of  $Y_n$  and  $Z_n$  are given by

$$F_{Y_n}(y) = \{F_X(y)\}^n, \quad F_{Z_n}(z) = 1 - \{1 - F_X(z)\}^n.$$

- (b) Suppose  $X_1, \dots, X_n \sim \text{Unif}(0, 1)$ , that is

$$F_X(x) = x, \quad \text{for } 0 \leq x \leq 1.$$

Find the cdfs of  $Y_n$  and  $Z_n$ .

- (c) Suppose  $X_1, \dots, X_n$  have cdf

$$F_X(x) = 1 - x^{-1}, \quad \text{for } x \geq 1.$$

Find the cdfs of  $Z_n$  and  $U_n = Z_n^n$ .

- (d) Suppose  $X_1, \dots, X_n$  have cdf

$$F_X(x) = \frac{1}{1 + e^{-x}}, \quad \text{for } x \in \mathbb{R}.$$

Find the cdfs of  $Y_n$  and  $U_n = Y_n - \log n$ .

- (e) Suppose  $X_1, \dots, X_n$  have cdf

$$F_X(x) = 1 - \frac{1}{1 + \lambda x}, \quad \text{for } x > 0.$$

Find the cdfs of  $Y_n$ ,  $Z_n$ ,  $U_n = Y_n/n$ , and  $V_n = nZ_n$ .

## For discussion

7. Let  $X_1, \dots, X_n \sim \text{UNIFORM}(0, 1)$  and let  $M_n = \max\{X_1, \dots, X_n\}$ .

- (a) Show that for  $\epsilon > 0$ ,

$$\Pr(M_n < 1 - \epsilon) = (1 - \epsilon)^n.$$

- (b) Use the result above to show that for all  $\epsilon > 0$

$$\lim_{n \rightarrow \infty} \Pr(|M_n - 1| \geq \epsilon) = 0.$$

*Later we will say that this shows that the random variable  $M_n$  converges in probability to the constant value 1.*

- (c) Now (by taking  $\epsilon = \frac{t}{n}$ ), show that the distribution function of the rescaled variable  $n(1 - M_n)$  converges to the CDF of a known distribution.

8. Suppose  $Y$  and  $\mathbf{X} = (X_1, X_2)^\top$  jointly follow a trivariate normal distribution. Here  $Y$  is a univariate random variable and  $\mathbf{Z} = (Y, X_1, X_2)^\top$  is a  $(3 \times 1)$  trivariate normal random vector with mean

$$\boldsymbol{\mu} = \begin{pmatrix} \mu_Y \\ \boldsymbol{\mu}_{\mathbf{X}} \end{pmatrix} \text{ and variance-covariance matrix } \mathbf{M}^{-1} = \begin{pmatrix} m_{YY} & \mathbf{M}_{Y\mathbf{X}} \\ \mathbf{M}_{Y\mathbf{X}}^\top & \mathbf{M}_{\mathbf{XX}} \end{pmatrix}^{-1},$$

where  $\mu_Y$  is the univariate mean of  $Y$ ,  $\boldsymbol{\mu}_{\mathbf{X}}$  is the  $(2 \times 1)$  mean vector of  $\mathbf{X}$ ,  $\boldsymbol{\mu}$  is the  $(3 \times 1)$  mean vector of both  $\mathbf{X}$  and  $Y$ ,  $m_{YY}$  is the first diagonal element of  $\mathbf{M}$ ,  $\mathbf{M}_{\mathbf{XX}}$  is the lower-right  $(2 \times 2)$  submatrix of  $\mathbf{M}$ , and  $\mathbf{M}_{Y\mathbf{X}}$  is the remaining off-diagonal  $(1 \times 2)$  submatrix of  $\mathbf{M}$ . (Note that we parameterize the multivariate normal in terms of the *inverse* of its variance-covariance matrix. This will significantly simplify calculations!)

- (a) Derive the conditional distribution of  $Y$  given both  $X_1$  and  $X_2$ . [Hint: Use vector/matrix notation.]
- (b) Now suppose  $Y$  and  $\mathbf{X} = (X_1, \dots, X_n)^\top$  jointly follow a multivariate normal distribution. Here  $Y$  remains a univariate random variable and  $\mathbf{Z} = (Y, X_1, \dots, X_n)^\top$  is an  $[(n+1) \times 1]$  multivariate normal random vector. Use the same notation for the mean and the inverse of the variance-covariance matrix, but with appropriately adjusted dimensions. Derive the conditional distribution of  $Y$  given  $X_1, \dots, X_n$ . [Hint: If you used vector/matrix notation in part (a), this problem will be very easy. If you did not, it will be very hard!]
- (c) Set  $n = 1$  and check that your answer is the same as the conditional distribution for the bivariate normal derived in lecture.
